Choosing Metric Units and Estimating

Metric units must match the attribute and size of the item.

Familiar benchmarks help make sensible estimates.

We are learning to...

identify which metric units are used to measure everyday items; use measurements of familiar items and known units to make estimates

Identify attribute

Choose unit

Use benchmark

Estimate

Check

Success criteria

- I can identify attributes.
- I can choose metric units.
- I can use benchmarks.

Key vocabulary

metric unit

attribute

estimate

Choose an appropriate unit

pencil
cm

room
m

apple
g

bag of rice
kg

cup
mL

bucket
L

Choose smaller units for smaller quantities and larger units for larger quantities.

Estimate from a familiar benchmark

door $\approx$ 2 m

desk $\approx$ 1 m

pencil $\approx$ 15 cm

benchmarks support estimates

An estimate should use a known measurement, not a random guess.

Show what you know

Choose a unit for pencil length.

Think silently, show your reasoning, then explain it to a partner.

Expected response

Centimetres are suitable for measuring a pencil's length.

If students are unsure

Length, mass and capacity use different units.

metric unit

attribute

estimate
