Multiplication and Division Strategies

Multiplication combines equal groups and division shares or groups equally. Arrays and partitioning make the structure of a problem visible.

We are learning to...

multiply and divide one- and two-digit numbers, representing problems using number sentences, diagrams and arrays, and using a variety of calculation strategies

Represent

Partition

Calculate

Connect inverse

Explain

Success criteria

- I can use arrays.
- I can partition multiplication.
- I can model division.

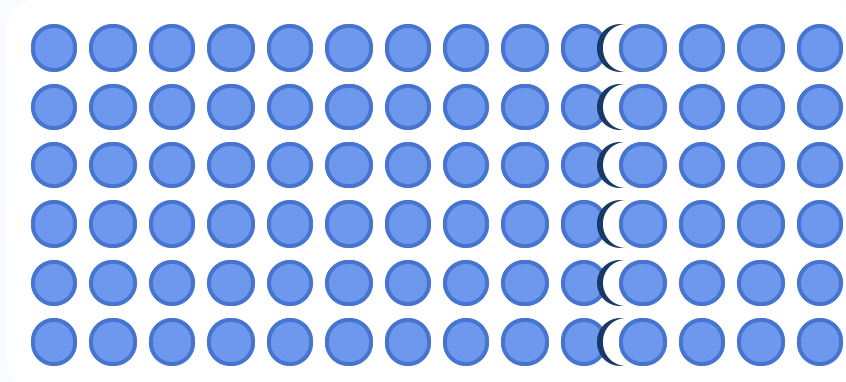

Key vocabulary

array

factor

quotient

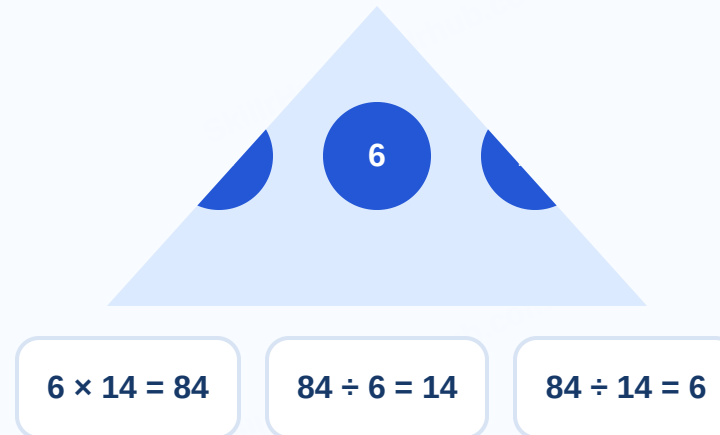

Partition 6×14

$$6 \times 14 = 6 \times 10 + 6 \times 4$$

Partition 14 into 10 and 4, then combine 60 and 24.

Connect multiplication and division

The same array represents related multiplication and division facts.

Show what you know

Solve 6×14 by partitioning.

Think silently, show your reasoning, then explain it to a partner.

Expected response

$6 \times 14 = 84$ because $6 \times 10 + 6 \times 4 = 60 + 24$.

If students are unsure

Multiplication and equal sharing require equal groups.
