

Convert between common metric units of length, mass and capacity; choose and use decimal representations of metric measurements relevant to the context of a problem

Learning intention

- convert between common metric units of length, mass and capacity; choose and use decimal representations of metric measurements relevant to the context of a problem.

Teach and model

- recognising the significance of the prefixes in units of measurement.
- recognising the equivalence of measurements, such as 1.25 metres is the same as 125 centimetres.
- identifying and using the correct operations when converting between units including millimetres, centimetres, metres, kilometres, milligrams, grams, kilograms, tonnes, millilitres, litres, kilolitres and megalitres.

Check understanding

- Explain the main idea and give one accurate example.
- Show the idea in a second way: with words, a model, a diagram or symbols.
- Apply the idea to a short unfamiliar situation and justify the result.

Teaching cautions

- Ask the student to explain their choice, not only state an answer.
- Check that key vocabulary is understood in a new example.
- Mix representations so the skill is transferred rather than copied.

Quick lesson sequence

- Connect to prior knowledge and introduce the key vocabulary.
- Model one clear example, then solve a second example together.
- Finish with an independent check and a short student explanation.
