

Analyse claims, inferences and conclusions of statistical reports in the media, including ethical considerations and identification of potential sources of bias

Learning intention

- analyse claims, inferences and conclusions of statistical reports in the media, including ethical considerations and identification of potential sources of bias.

Teach and model

- using secondary data to predict the number of people likely to be infected with a strain of flu or experience side effects with a certain medication.
- recognising how the identification of bias is a critical aspect of machine learning and deep learning because biases can significantly impact the fairness.
- investigating the source and size of the sample from which the data was collected and deciding whether the sample is appropriately representative of the population.

Check understanding

- Explain the main idea and give one accurate example.
- Show the idea in a second way: with words, a model, a diagram or symbols.
- Apply the idea to a short unfamiliar situation and justify the result.

Teaching cautions

- Ask the student to explain their choice, not only state an answer.
- Check that key vocabulary is understood in a new example.
- Mix representations so the skill is transferred rather than copied.

Quick lesson sequence

- Connect to prior knowledge and introduce the key vocabulary.
- Model one clear example, then solve a second example together.
- Finish with an independent check and a short student explanation.
