

Solve problems involving the duration of time including situations involving “am” and “pm” and conversions between units of time

Learning intention

- solve problems involving the duration of time including situations involving “am” and “pm” and conversions between units of time.

Teach and model

- calculating the amount of time between 2 events, such as the start and finish of a movie, a bus journey or a flight.
- converting units of time using relationships between units, such as 60 minutes in an hour and 60 seconds in a minute, to solve problems.

Check understanding

- Explain the main idea and give one accurate example.
- Show the idea in a second way: with words, a model, a diagram or symbols.
- Apply the idea to a short unfamiliar situation and justify the result.

Teaching cautions

- Ask the student to explain their choice, not only state an answer.
- Check that key vocabulary is understood in a new example.
- Mix representations so the skill is transferred rather than copied.

Quick lesson sequence

- Connect to prior knowledge and introduce the key vocabulary.
- Model one clear example, then solve a second example together.
- Finish with an independent check and a short student explanation.
