

Conduct repeated chance experiments to observe relationships between outcomes; identify and describe the variation in results

Learning intention

- conduct repeated chance experiments to observe relationships between outcomes; identify and describe the variation in results.

Teach and model

- shuffling a set of cards, drawing a card at random, and recording whether it was a spade, club, diamond or heart.
- experimenting with tossing 2 coins at the same time, recording and commenting on the chance of outcomes after a number of tosses.
- recording and ordering the outcomes of experiments using different physical or virtual random generators such as coins, dice and a variety of spinners.

Check understanding

- Explain the main idea and give one accurate example.
- Show the idea in a second way: with words, a model, a diagram or symbols.
- Apply the idea to a short unfamiliar situation and justify the result.

Teaching cautions

- Ask the student to explain their choice, not only state an answer.
- Check that key vocabulary is understood in a new example.
- Mix representations so the skill is transferred rather than copied.

Quick lesson sequence

- Connect to prior knowledge and introduce the key vocabulary.
- Model one clear example, then solve a second example together.
- Finish with an independent check and a short student explanation.
