Estimating Quantities and Answers

An estimate is a sensible approximate value based on evidence. Benchmarks, equal groups and rounded numbers help judge whether an exact answer is reasonable.

We are learning to...

estimate the quantity of objects in collections and make estimates when solving problems to determine the reasonableness of calculations

**Choose
benchmark****Group****Estimate****Calculate if
needed****Check reasonableness**

Success criteria

- I can use benchmarks.
- I can group collections.
- I can round to friendly numbers.

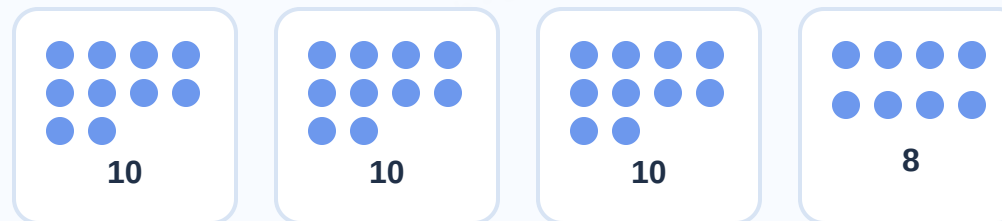

Key vocabulary

estimate

benchmark

reasonable

Estimate a collection by grouping

about 40 objects

Count one useful group, compare the remaining groups and adjust.

Estimate before calculating

 $398 + 205$

→

 $400 + 200$

→

about 600

→

exact 603

The estimate shows that 603 is reasonable.

Show what you know

Estimate $398 + 205$.

Think silently, show your reasoning, then explain it to a partner.

Expected response

$398 + 205$ is about 600.

If students are unsure

Use a benchmark or grouping strategy.

estimate

benchmark

reasonable
