Repeated Chance Experiments

Repeated chance experiments produce results that can vary. More trials give more evidence about patterns, but exact counts are not guaranteed.

We are learning to...

conduct repeated chance experiments; identify and describe possible outcomes, record the results, recognise and discuss the variation

List outcomes

Predict

Repeat trials

Tally

Compare results

Discuss variation

Success criteria

- I can identify outcomes.
- I can conduct repeated trials.
- I can record frequencies.

Key vocabulary

chance experiment

trial

variation

Record 20 spinner trials

Outcome	Tally	Frequency
Red		12
Blue		8

The frequencies show what happened in this set of trials.

Compare two trial sets

Set A: 12 red, 8 blue

Set B: 9 red, 11 blue

variation is normal

A fair chance process can still produce different results in separate runs.

Show what you know

List coin outcomes.

Think silently, show your reasoning, then explain it to a partner.

Expected response

The possible coin-toss outcomes are heads and tails.

If students are unsure

Equal chances do not guarantee equal results in a small trial.
