Creating and Comparing Data Displays

The same data can be represented in tables, picture graphs or column graphs. Good displays preserve the data and make the question easier to answer.

We are learning to...

create and compare different graphical representations of data sets including using software where appropriate; interpret the data in terms of the context

Check data

Choose display

Label axes/key

Plot accurately

Compare

Interpret

Success criteria

- I can create graphs.
- I can use labels and scale.
- I can compare displays.

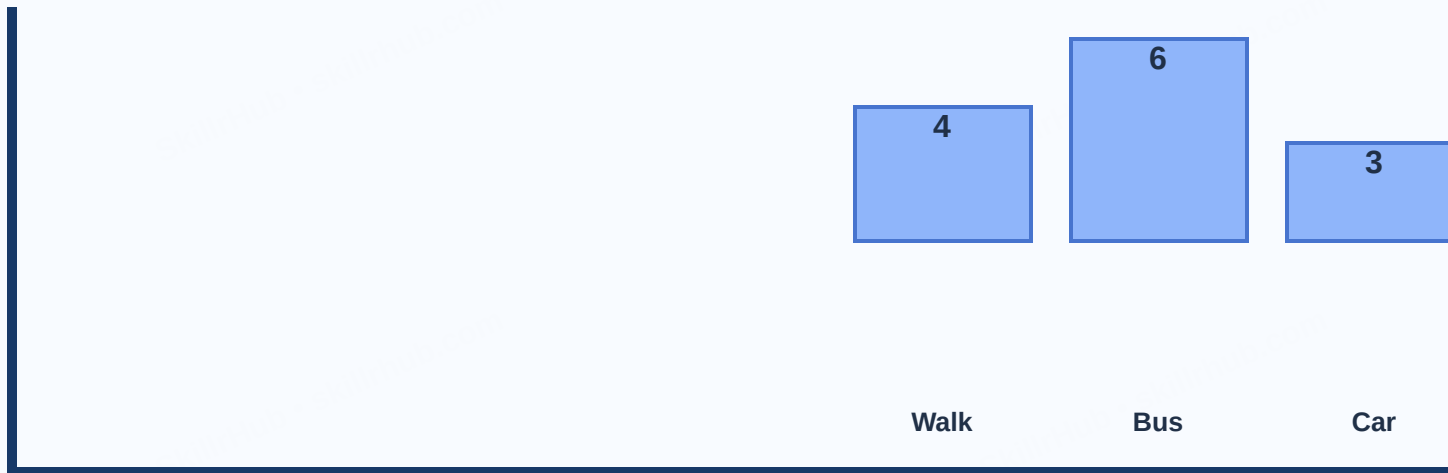

Key vocabulary

data display

scale

interpret

Turn a frequency table into a column graph

Bar heights must match the frequencies and categories need labels.

Compare two representations

table gives exact values

graph shows comparison quickly

both use same data

choose for purpose

Interpret the display in the context, not just as isolated numbers.

Show what you know

What must stay the same across displays?

Think silently, show your reasoning, then explain it to a partner.

Expected response

Category frequencies must remain unchanged when data moves from a table to a graph.

If students are unsure

Every value must match the source.
