

Splitting an Array

Elaboration 2 · Partitioning arrays with number facts

ELABORATION FOCUS

Finding the total in an array by splitting it into parts, using subitising and known number facts.

LEARNING INTENTION I can split an array into parts to find the total.

See it

Split it

2 fives is 10

5 more

15

1

Look at the Array

Step 1: look at the rows. Step 2: see how many dots are in each row.

2

Split Off a Part You Know

Step 3: cover the last row. Step 4: 2 fives is 10.

3

Add On the Rest

Step 5: add the last row back on. 10 and 5 more makes 15.

MODEL · SPLITTING A 3 FIVES ARRAY

Split 3 fives into 2 fives and 1 more five.

2 fives = 10

5 more

$$10 + 5 = 15$$

I saw 2 fives which is 10, and then 5 more, which makes 15.

TEACHER MODELLING ROUTINE I do → We do → You do

WATCH FOR

Counting every dot by ones instead of using a fact they already know.

REMEMBER

Split off a part you know, then add on what is left.

MATERIALS

Dot cards, counters, array mats, ten-frames, cover cards.
